

Description

Hints

Creating the ChatApp Backend

Task Points: 100 ~~200~~ ?

Task Status: **Completed**

Task details

Deliverable

1. Create an Api that every time a user sends a chat message it gets stored in the database.
2. Think about the database table schema so that you can store id of the user who sent the chat message and what was the message. **Discuss this with your mentor once if you are not confident.**
3. Integrate this API with the frontend so that whatever chat message user sends , it gets updated to the database
